

ABSTRACT OF THE DISCLOSURE

On a screen a file processing apparatus displays values of an attribute related to a plurality of files using a concept of weight. The weight of each file is represented in one embodiment by spherical objects submerged into the water and displayed on the screen. For example, a first spherical object represents a file whose data size is large, and is sunk near bottom. And a second spherical object represents a file whose data size is light and is floating near the water surface.
